DISCUSSION: The Site Inspection Prioritization (SIP) for this site prepared by the Alternate Remedial Contracting Strategy (ARCS) contractor was reviewed. This 0.46 acre facility was used for the open dumping of various solid and liquid oil field wastes from off-shore drilling rigs. Sample results have shown contaminated soil is present on-site.

No release to the ground water is suspected because the site is underlain by 200 feet of clay. Ground water in the area is primarily used for purposes other than as a drinking water source. The nearest well is located approximately 0.5 mile from the site and is relatively deep at 500 feet below ground surface.

Samples collected during the 1991 Screening Site Inspection did not show evidence that the surface water pathway has been affected by conditions at the site.

The site is fenced and is not accessible to the public. The nearest residence is located over 2000 feet from the site, reducing the potential for contact with contaminated soils.

Based on the results of the SIP, this site will not qualify for further evaluation as a potential candidate for inclusion on the National Priorities List of Superfund sites. The site will be returned to the Louisiana Department of Environmental Quality for any further action, if appropriate, under state regulations.
